

# SOLAR

## *Large commercial solar*

Electrical Sensations solar team works with our clients to develop projects that focus on offsetting current energy usage and reducing their energy costs.

By examining a client's energy profile, site & location variables, and then listening to their financial goals, our team is able to calculate the size of commercial solar power installation most appropriate for the client.

## *Solar coupled with peak demand control*

With up to 50% of a large commercial electricity bills being demand charges, it makes sense to control your peak demand. The problem with standard solar is that if your peak occurs when there is no sun e.g. at night or when a cloud comes over, the solar alone can't help, BUT if your usual peak occurs during the day and you have solar installed in conjunction with peak shaving equipment, your facility can reduce their demand peaks as well as their consumption and therefore reduce their energy costs.

## *Why use Electrical Sensations*

- Fully licenced electrical contractors.
- Comprises a team of highly experienced installers, designers, engineering, and finance consultants.
- Project specific safety plans.
- Safety always comes first.
- Components that are well proven both in terms of quality and reliability and that we know will go the distance.
- Your project on time and on budget – with no surprises.
- All projects are designed to have minimal impact on day to day operations of our client's business.

## *What to do next*

The business needs to get as much information about your energy use as possible, the first step would be to ask your energy retailer for your interval data, and install energy monitoring.

The second step is to contact the Electrical Sensations team on 07 4637 2744 to discuss these solutions in further detail.
